

# Where are the women?

## Global gender gaps in technology and innovation

Sophia Huyer,  
Executive  
Director, WISAT

# National Assessments on Gender and STI

# Overall Findings

- The gender knowledge divide exists and flourishes in all countries, even those with a highly-developed knowledge economy
- Gendered barriers to participation in STI and technology exist -> this situation will not improve automatically with GDP, increased education or increased internet availability.

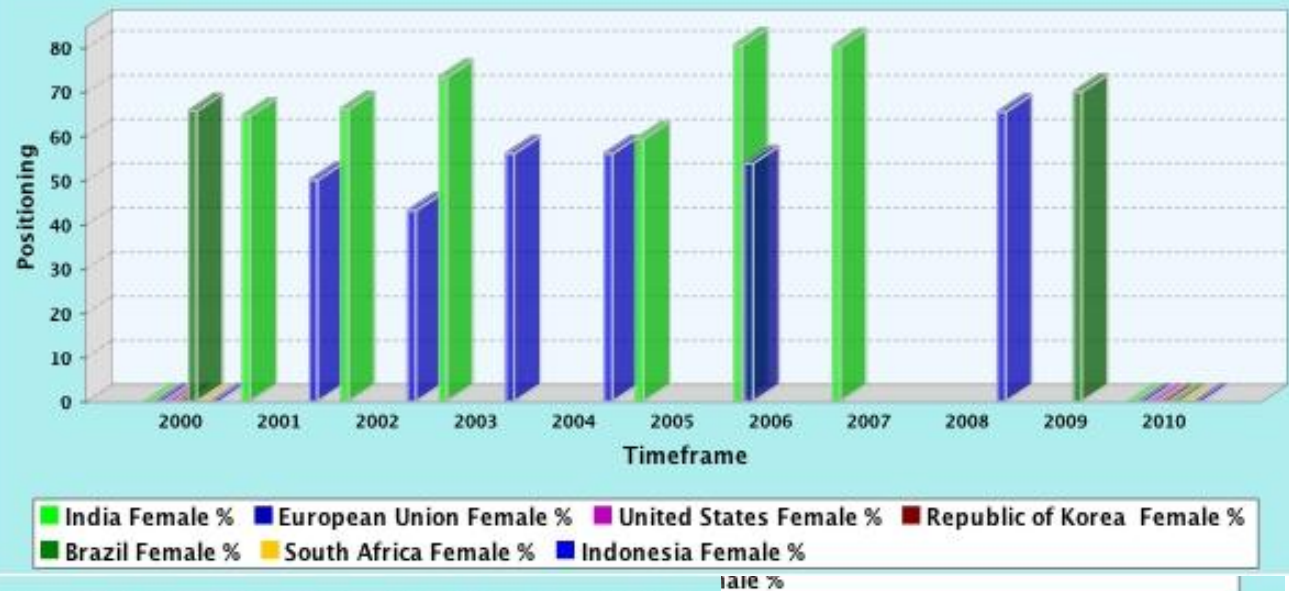

# Knowledge economy

# STI participation

Science, technology and innovation participation: tertiary biology, medical, and life sciences enrollment

Science, technology and innovation participation: tertiary engineering and physics including computer sciences enrollment

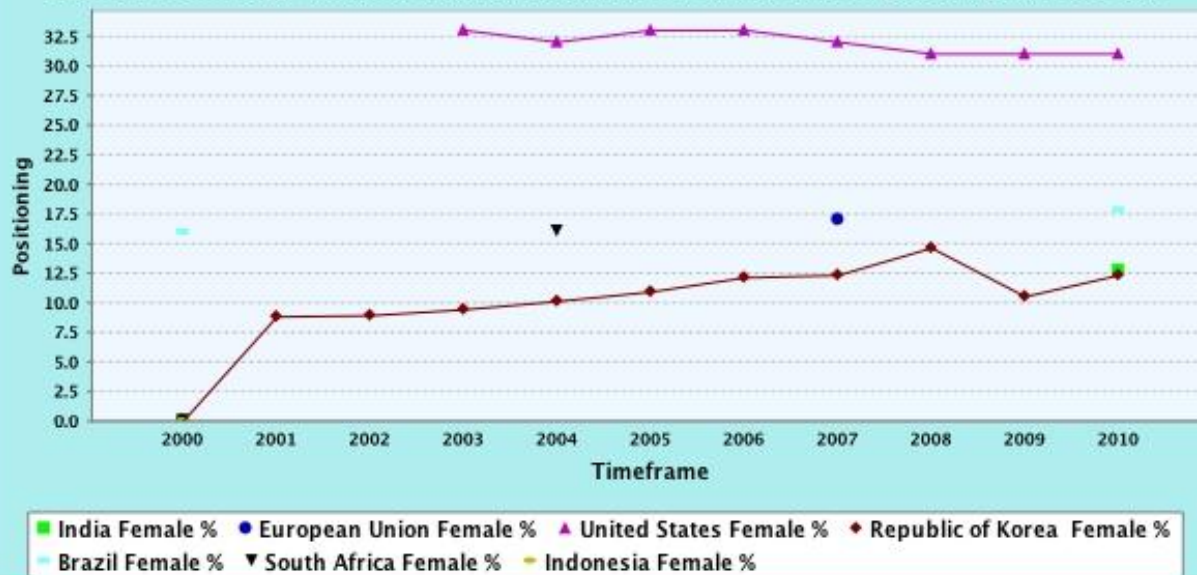

# Enrolments vs Workforce

Science, technology and innovation participation: tertiary science and engineering enrollment

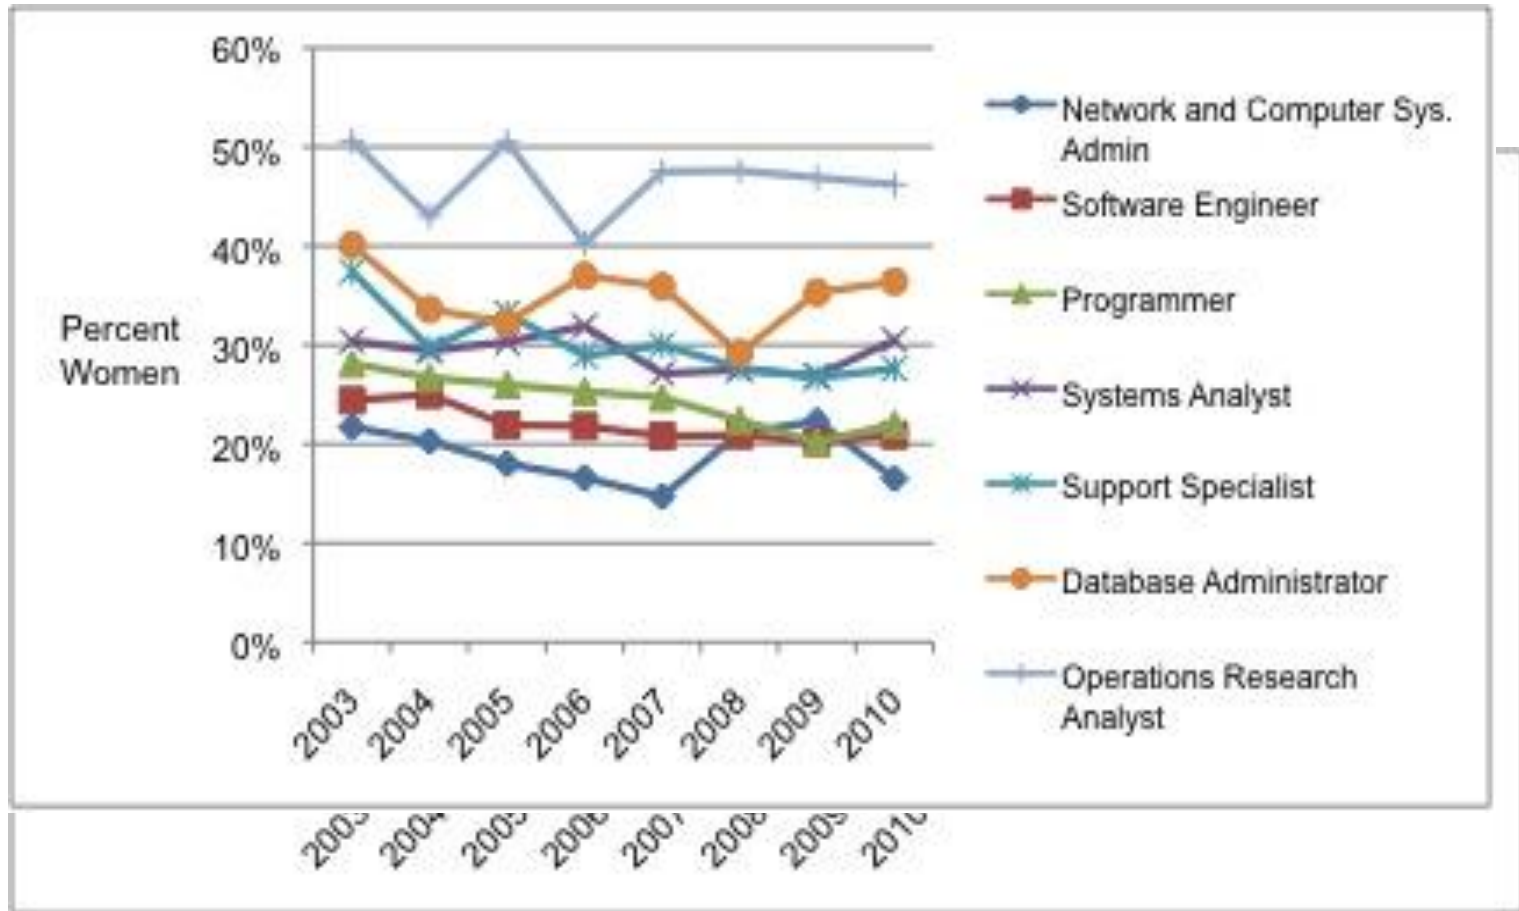

Science, technology and innovation participation: science and engineering labour force

# Declines in some sectors

Women in selected fields requiring high-level computer skills

# Knowledge Economy Decision Making

Knowledge society decision-making: participation on corporate boards: 2010

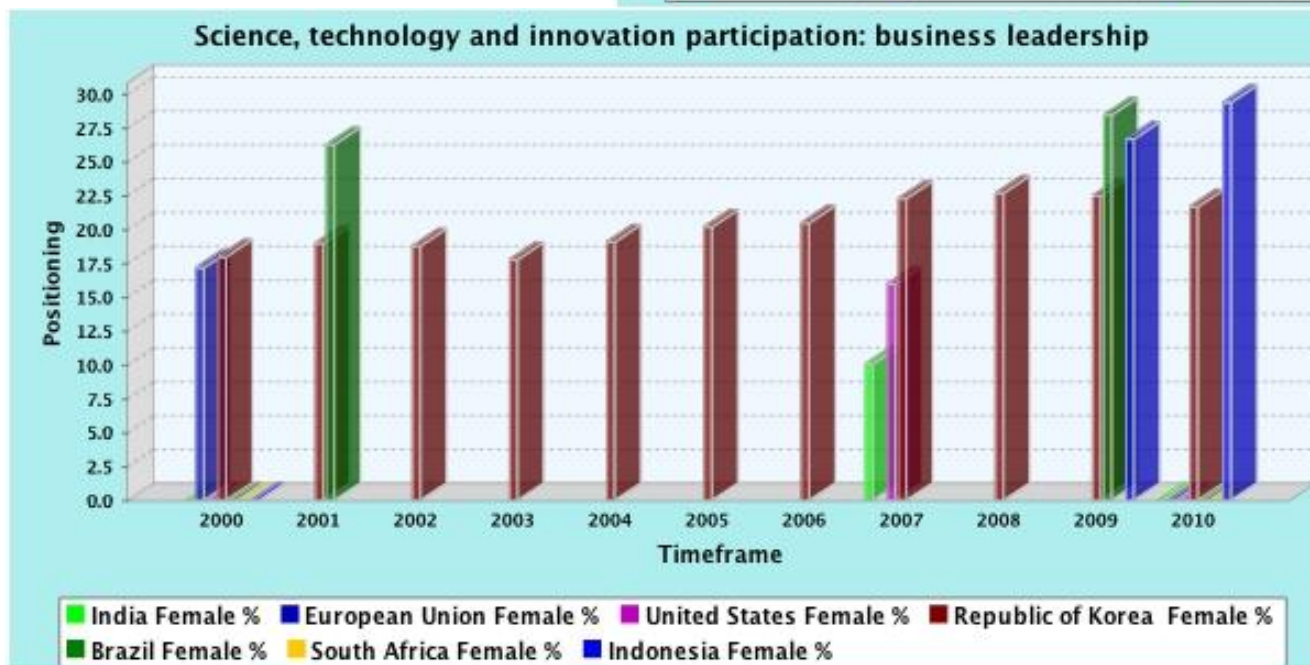

Knowledge society decision-making: management participation

female % ■ Republic of Korea Female %  
female % ■ Indonesia Female %

# STI participation

# What are the main findings?

- Approximate parity in some countries in S&E overall -> surprising results for some advanced countries
- Under-representation in engineering, physics and computer science — lower than 30%, South Korea 11%
- Declining representation of females in the IT and STEM labourforce in most countries
- Low representation in STI decision making and entrepreneurship

# Why is this happening?

- Unfriendly work environment and expectations for women
- Social attitudes
- Control over resources
- Work-life balance
- Cultural restrictions with respect to safety and mobility

# Country Profile: South Korea

Rank	6th
Overall comments	A surprising under-representation in STI and other sectors of the economy, despite policy efforts. A supporting policy environment but low presence in the economy or STEM education
Knowledge economy Decision making	17% of ministers, 9.4% of women legislators and senior officials and managers – increasing since 2004. 3.5% of chief executives and senior government officials.
Private sector	1% female representation on boards of major companies – one of the world's lowest
Knowledge economy	Low participation: fewer than 10% of engineering professionals and one-eighth of those in working in ICT – and decreasing.
STI enrolment & workforce	44% of enrolments in natural sciences. In professional engineering jobs, women make up 11.3%, compared to 31.4% in scientific professions leading to 12.3 % in overall science and engineering workforce.
Entrepreneurship	Under 5% of businesses are run by women
Education	Parity in lower levels, 2:3 gap in tertiary
Access to resources	No legal barriers, but trend is for male ownership Close to equal use of mobiles and internet.

# Country Profile: Brazil

Rank	3 (after US and Europe)
Overall comments	Solid supporting policy + implementation
Access to resources	Equal access to property, infrastructure, ICT
Education	Parity at primary levels, majority at secondary and tertiary levels; financial support at tertiary level and above
KS Decision making	Less than 5 % ministers at national and state levels low, but increasing somewhat - 8% at state level (201), 26% at national level after Rousseff took office (2011)
Private sector	President-CEO (21.4%), Vice President (17.5%) and Director (26.3%) in 2008-9
Knowledge economy	44.8% legislators, senior officials and managers, 55% of technicians and associate professionals at 55% . IT workers is low: 13.7% , but over 60% of “biotechnology professional”, “Information professional”, and “support technician”
STI enrolment & workforce	58% in health and biological (62%) sciences; 47% in agricultural sciences; 33% in engineering and 37.5% in "exact" sciences – some rates are increasing -> drops in the workforce
Entrepreneurship	17% of new enterprises, 29% of businesses employing more than one person.

# There is no simple solution

- “Getting women into science” is inadequate
- A multi-dimensional approach is required
- Good policy – public and private
- Changes in the workplace – and in attitudes
- Critical influencing factors

Thank you!
